In addition to sustaining business growth, applications need to be continually enhanced to accommodate changing business rules and enhance service delivery. Virtualization can be used to consolidate servers and storage resources in many environments to boost resource utilization and contain costs—for example, using a software-based virtual machine VM to combine applications and operating systems images from underutilized The Green and Virtual Data Center servers to virtual machines on a single server. Similarly, magnetic tape devices may need to coexist with newer disk-based systems, and LANs may need to coexist with networks using copper, optical, and even wireless communications.
