Comparison between biomarkers - historical perspective
Measurement of lactic dehydrogenase LDH and transaminases ASTmarkers that increase in association with extensive myocardial necrosis, is no longer recommended due to their low specificity when compared with that of creatine kinase CK isoforms. To obtain the best experience, Valvular Heart Disease (Contemporary Cardiology) recommend you use a more up to date browser or turn off compatibility mode in Internet Explorer.

Repeat exposure to group A streptococcal m protein exacerbates cardiac damage
Rupture of a papillary muscle necessitates urgent surgical treatment after stabilization of the haemodynamic status, using an intra-aortic balloon pump and vasodilators.

Similarly, repeat PMC can be proposed in selected patients with the same characteristics as mentioned earlier if restenosis occurs several years after an initially successful PMC.

It is the first step in the diagnosis of VHD and the assessment of its severity.
dilatation, distortion, and dyssynchrony are linked to functional MR in patients with heart failure and LV dysfunction.
